Extracting iOS' Passcode Blacklist

Maximilian Golla

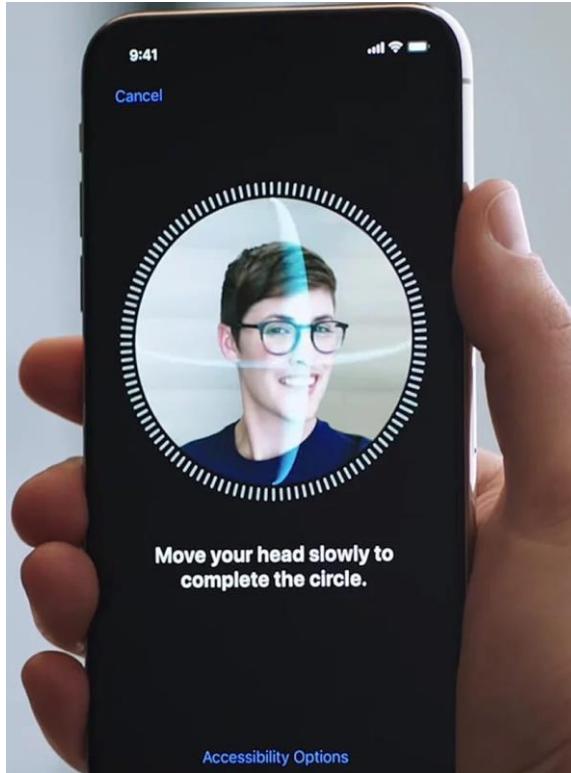

March 2020 | Bochum, Germany

Biometric-Based Reauthentication

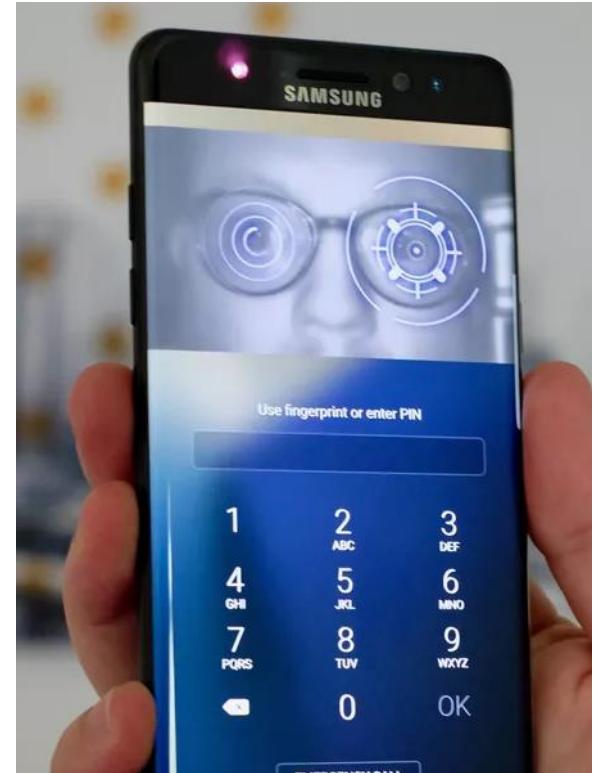

“Face unlock feels almost like not having any lock screen security.”

Fingerprint

Face

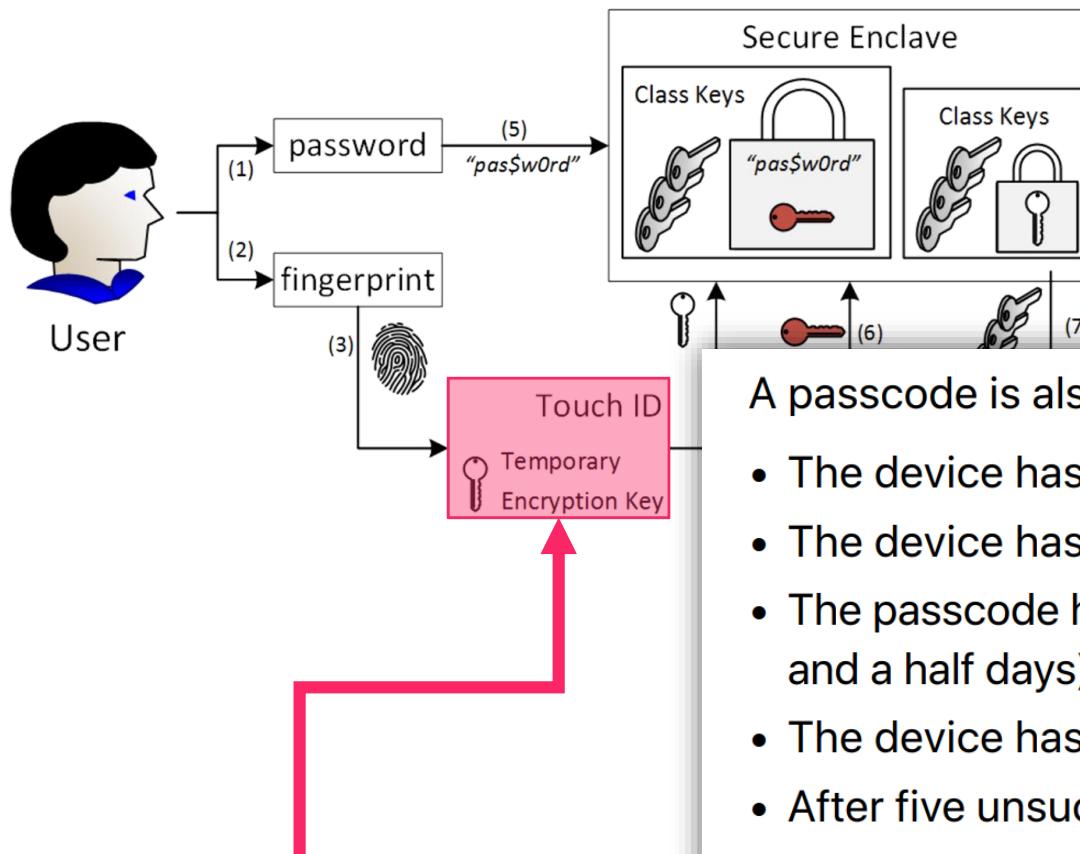

Iris

“Intelligent Scan”

Biometrics are a Convenience Feature!

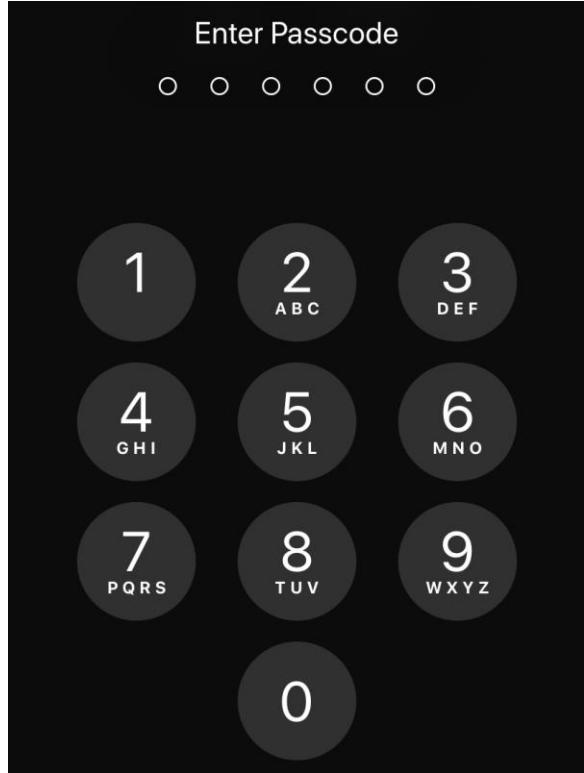

TEK is flushed periodically
and on device reboot.

A passcode is also required if your device is in the following states:

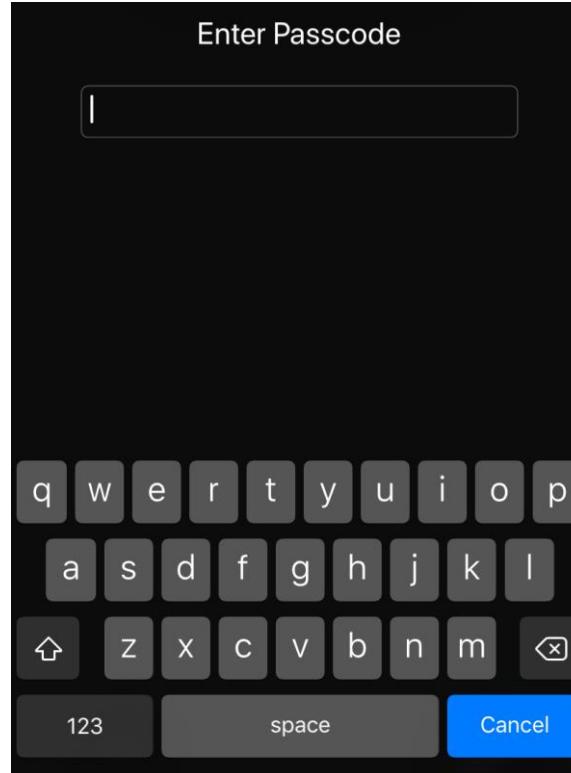

- The device has just been turned on or restarted.
- The device hasn't been unlocked for more than 48 hours.
- The passcode hasn't been used to unlock the device in the last 156 hours (six and a half days) and a biometric hasn't unlocked the device in the last 4 hours.
- The device has received a remote lock command.
- After five unsuccessful biometric match attempts.
- After initiating power off/Emergency SOS.

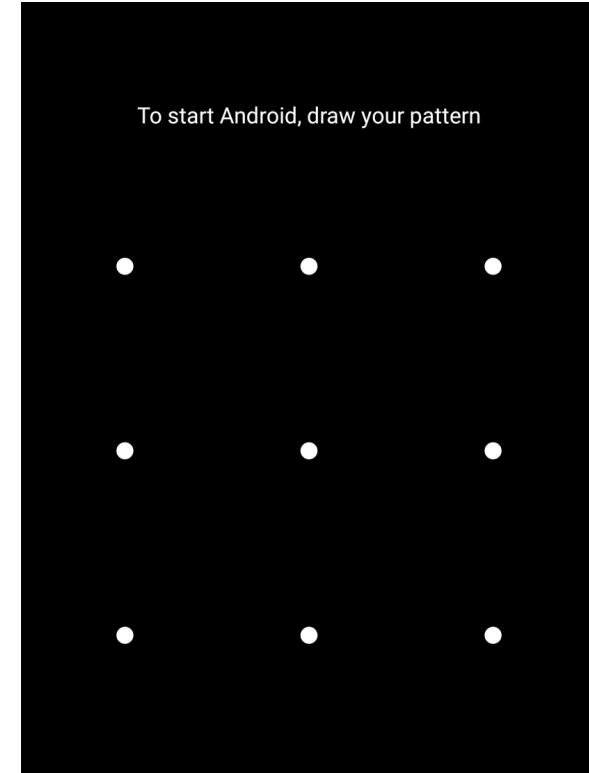

Knowledge-Based Authentication

4/6-digit PINs

Passwords

Pattern

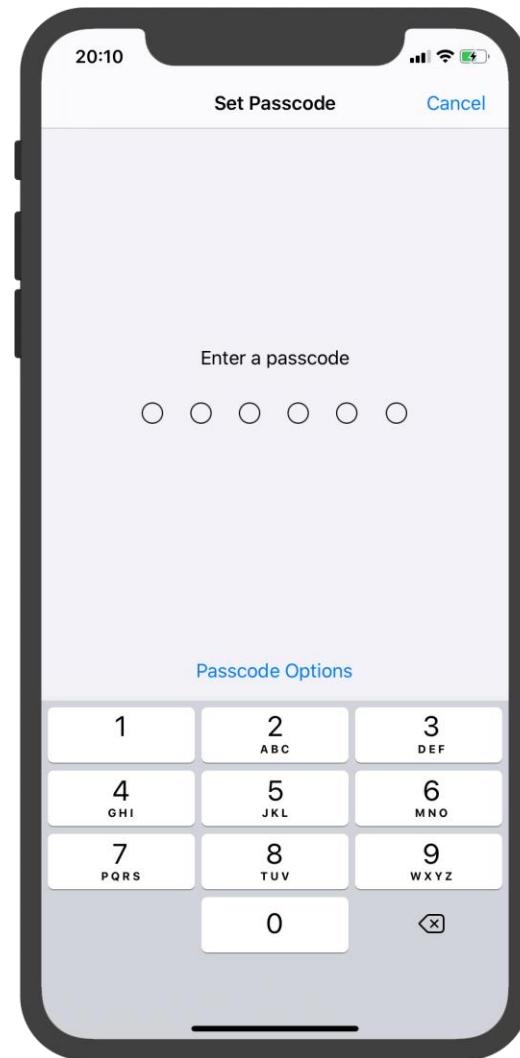

iOS Passcode

Knowledge-based auth. scheme

- **6-Digit Numeric Code (default)**
- 4-Digit Numeric Code
- Custom Numeric Code
- Custom Alphanumeric Code

Strict rate-limiting (10 guesses)

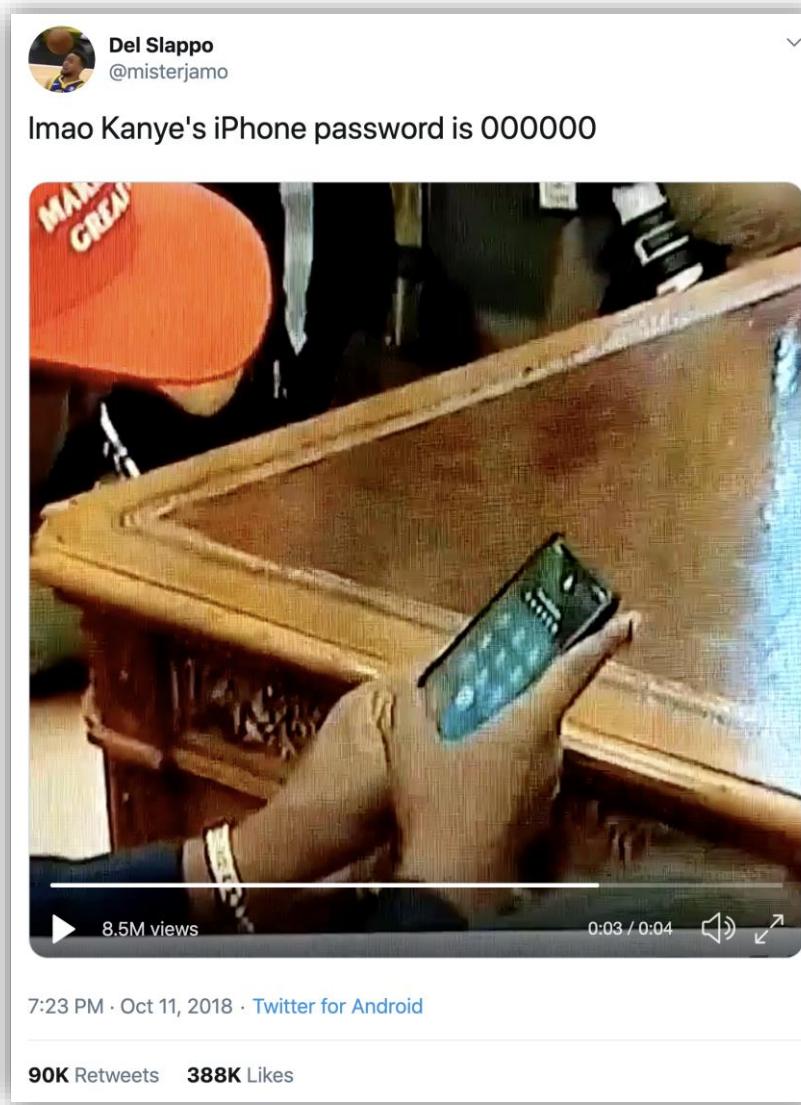

Enrollment

Authentication

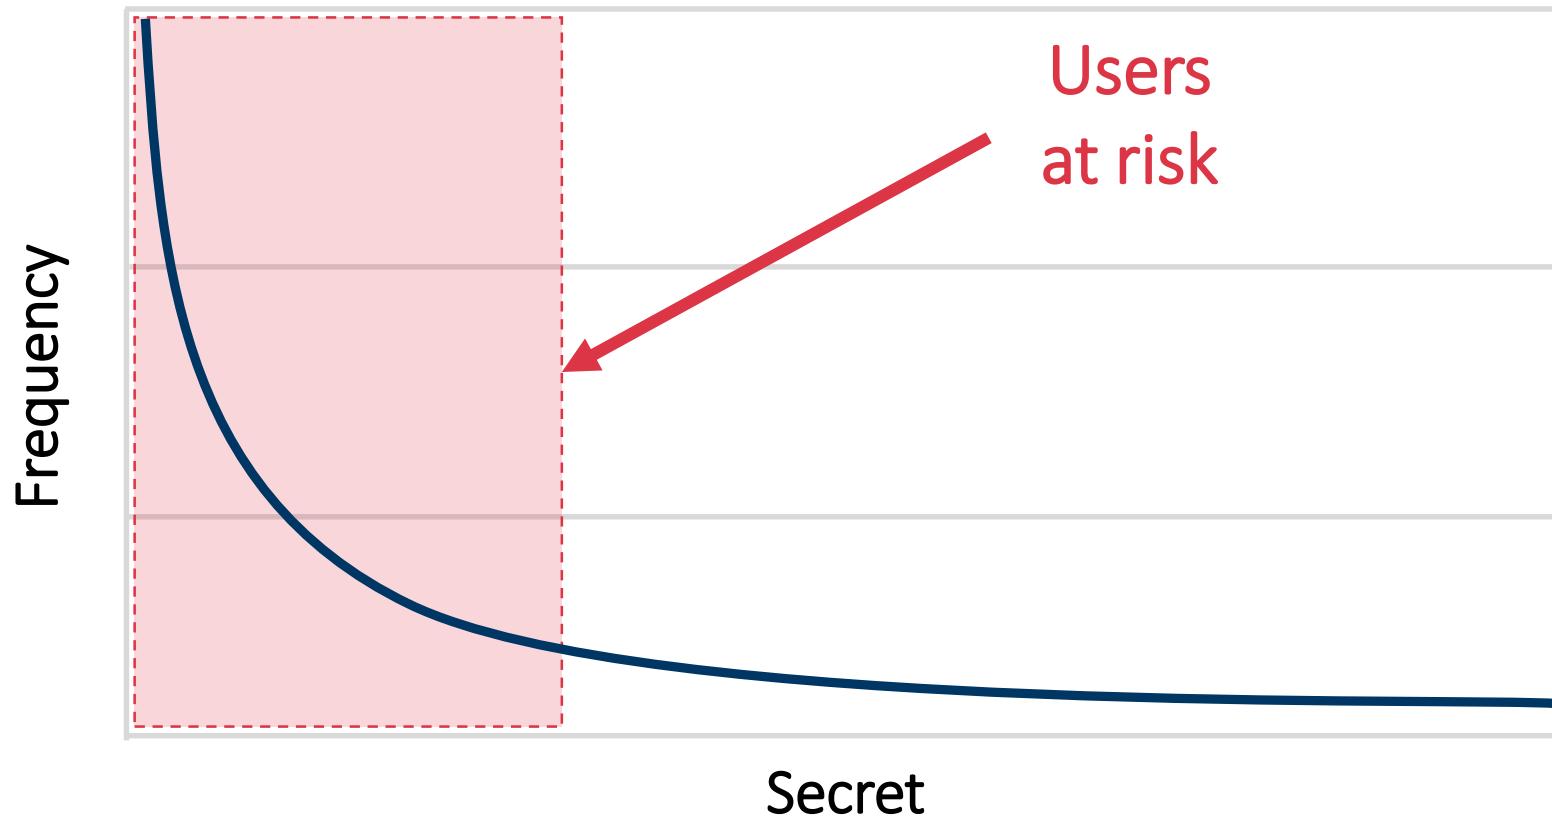

User-Chosen PINs

Selection Bias

User-choice heavily biased.

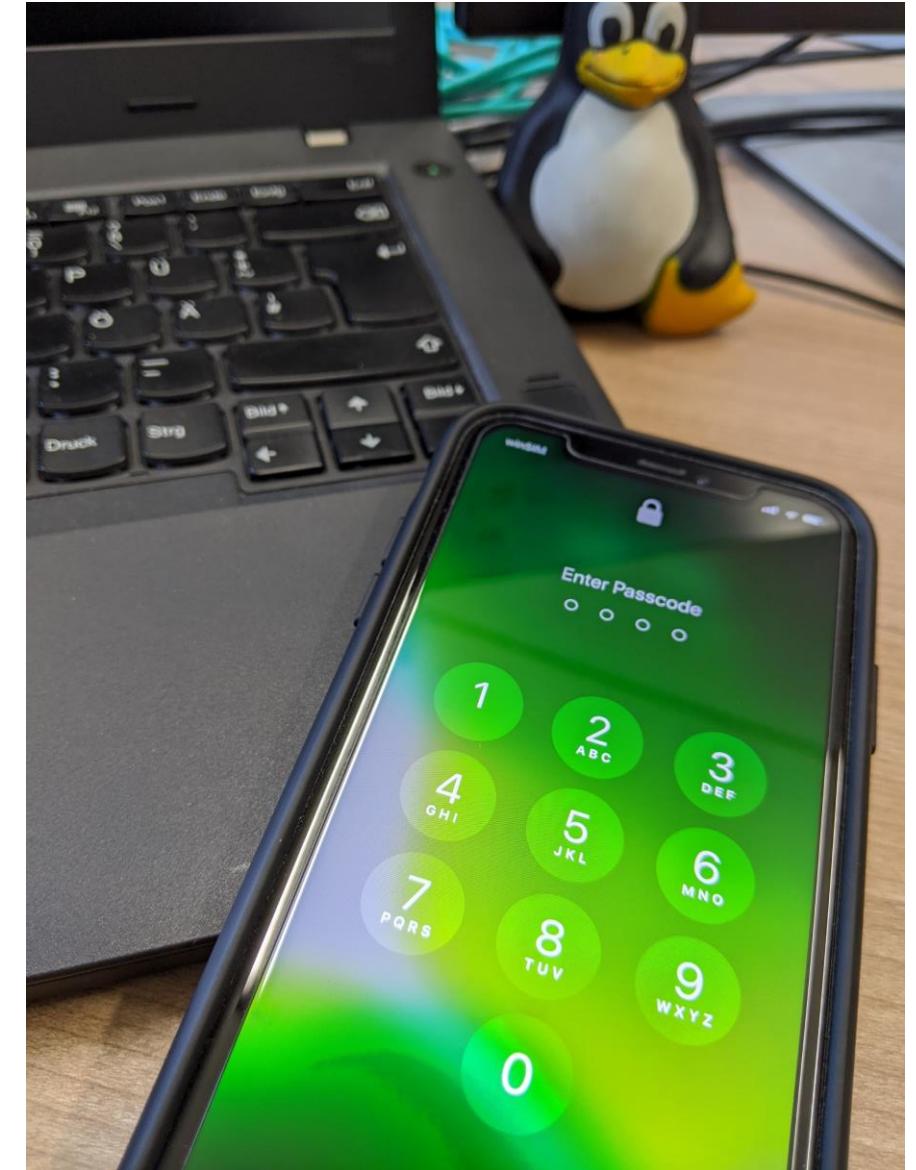

Threat Model

Attacker guesses the n most common secrets in decreasing order of success.

Throttled Guessing Attack:

	iOS 9-13	Android 7-10
3 Guesses	00s	00s
10 Guesses	1h 36m 00s	30s
30 Guesses	Disabled	10m 30s
100 Guesses	Disabled	10h 45m 30s

What This Talk is Not About!

~~iPhone unlocking as used by law enforcement.~~

→ We only extract the iOS Passcode blacklist!

iOS Passcode Blacklist

- “Blacklist” consisting of weak PINs
- Not documented
- Allows users to click-through (“Use Anyway”)

Examples:

“000000”

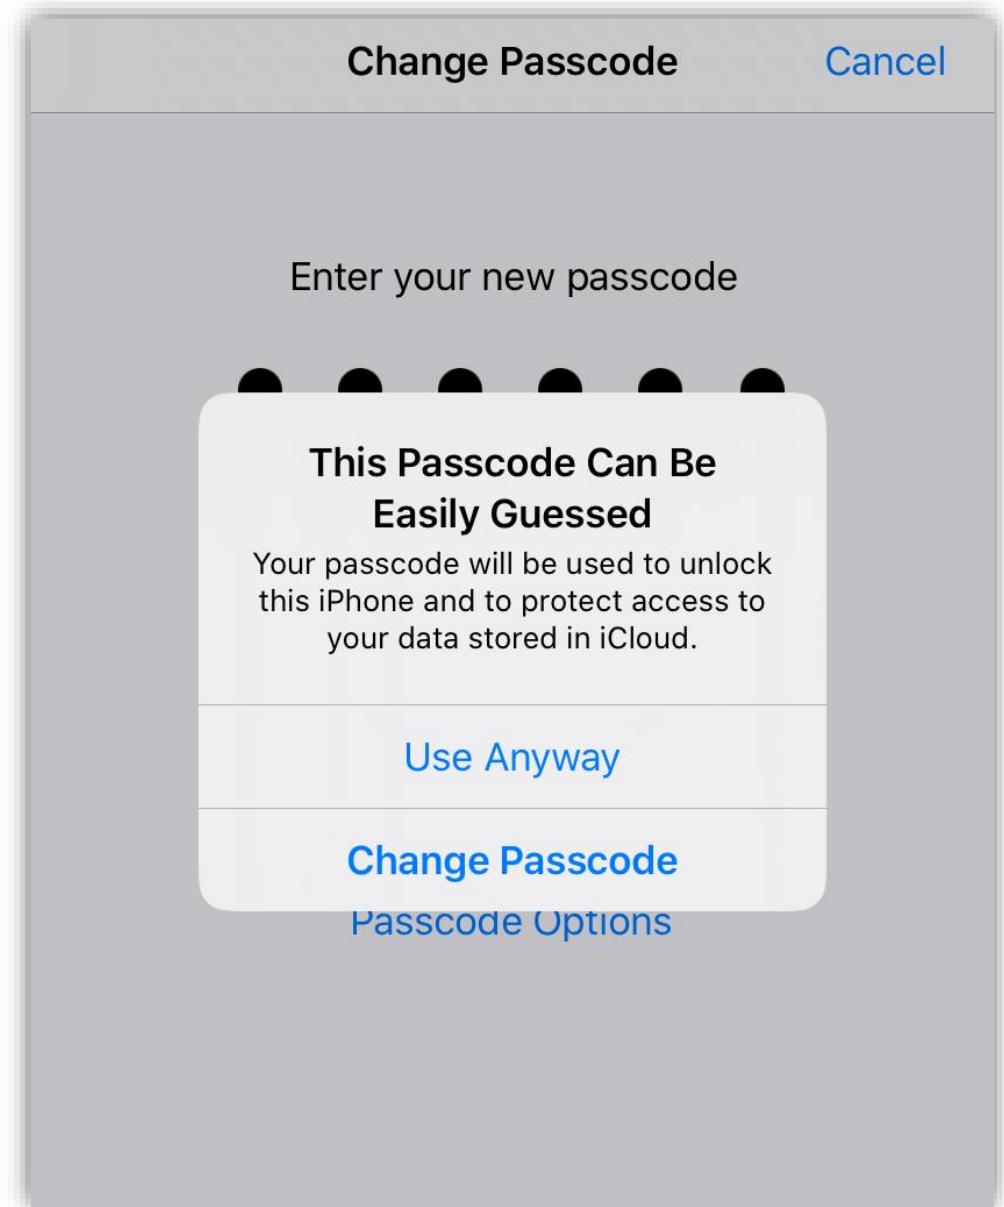

“123456”

or

“2580”

“1956”

How to obtain the only “available” PIN blacklist on the market?

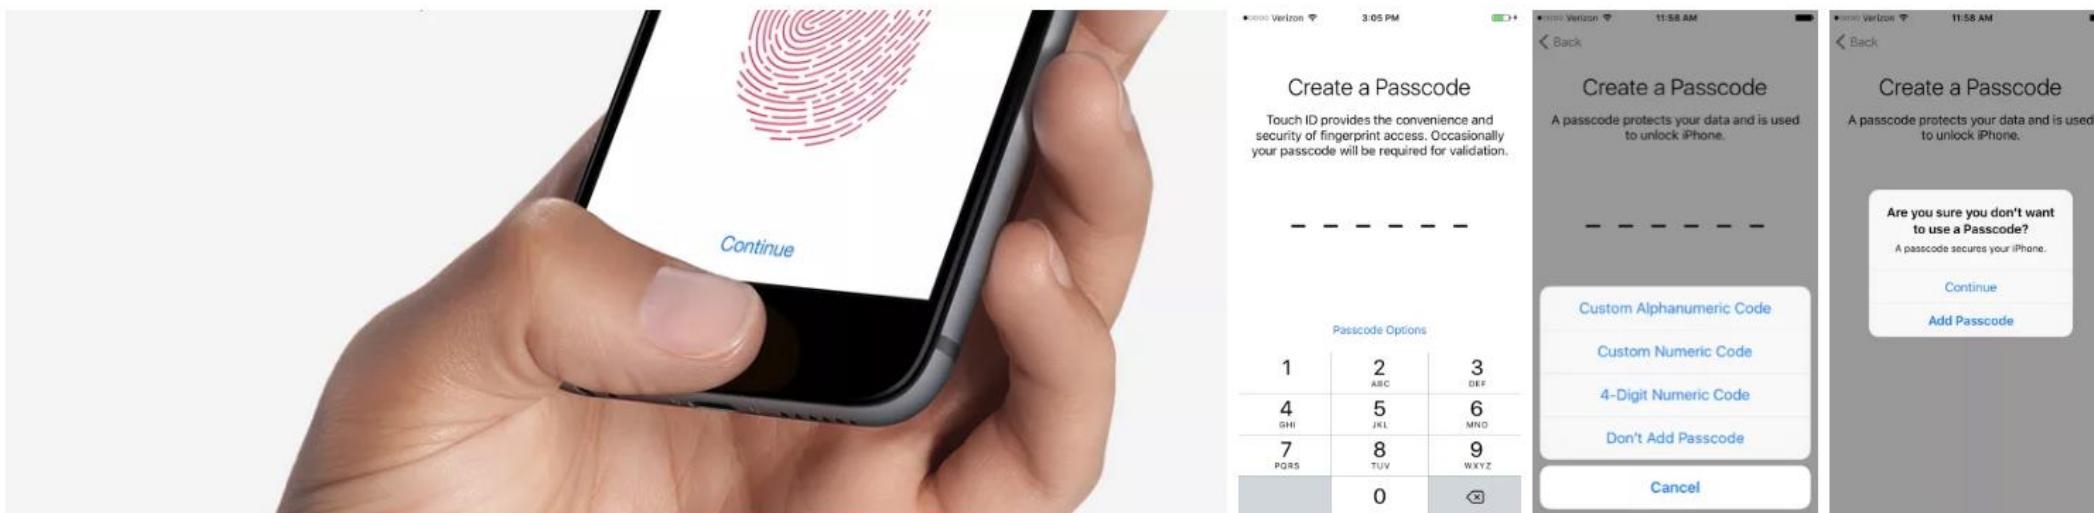

Documentation?

When creating a Passcode, the system is smart and does detect if you are wanting to use a simple, easy to guess, commonly used passcode and it has you confirm whether or not you want to do it.

Examples of easy to guess, commonly used passcodes are 000000, 111111, 222222, 123456, etc.

Before iOS 7, if you use a simple, easy to guess, commonly used passcode it did allow you to proceed and create the passcode without questioning you. Having a passcode is not required, and you can choose to not have a passcode by tapping on the Passcode Option. However, if you want to use **iCloud Keychain** and Touch ID, it is required to have a passcode.

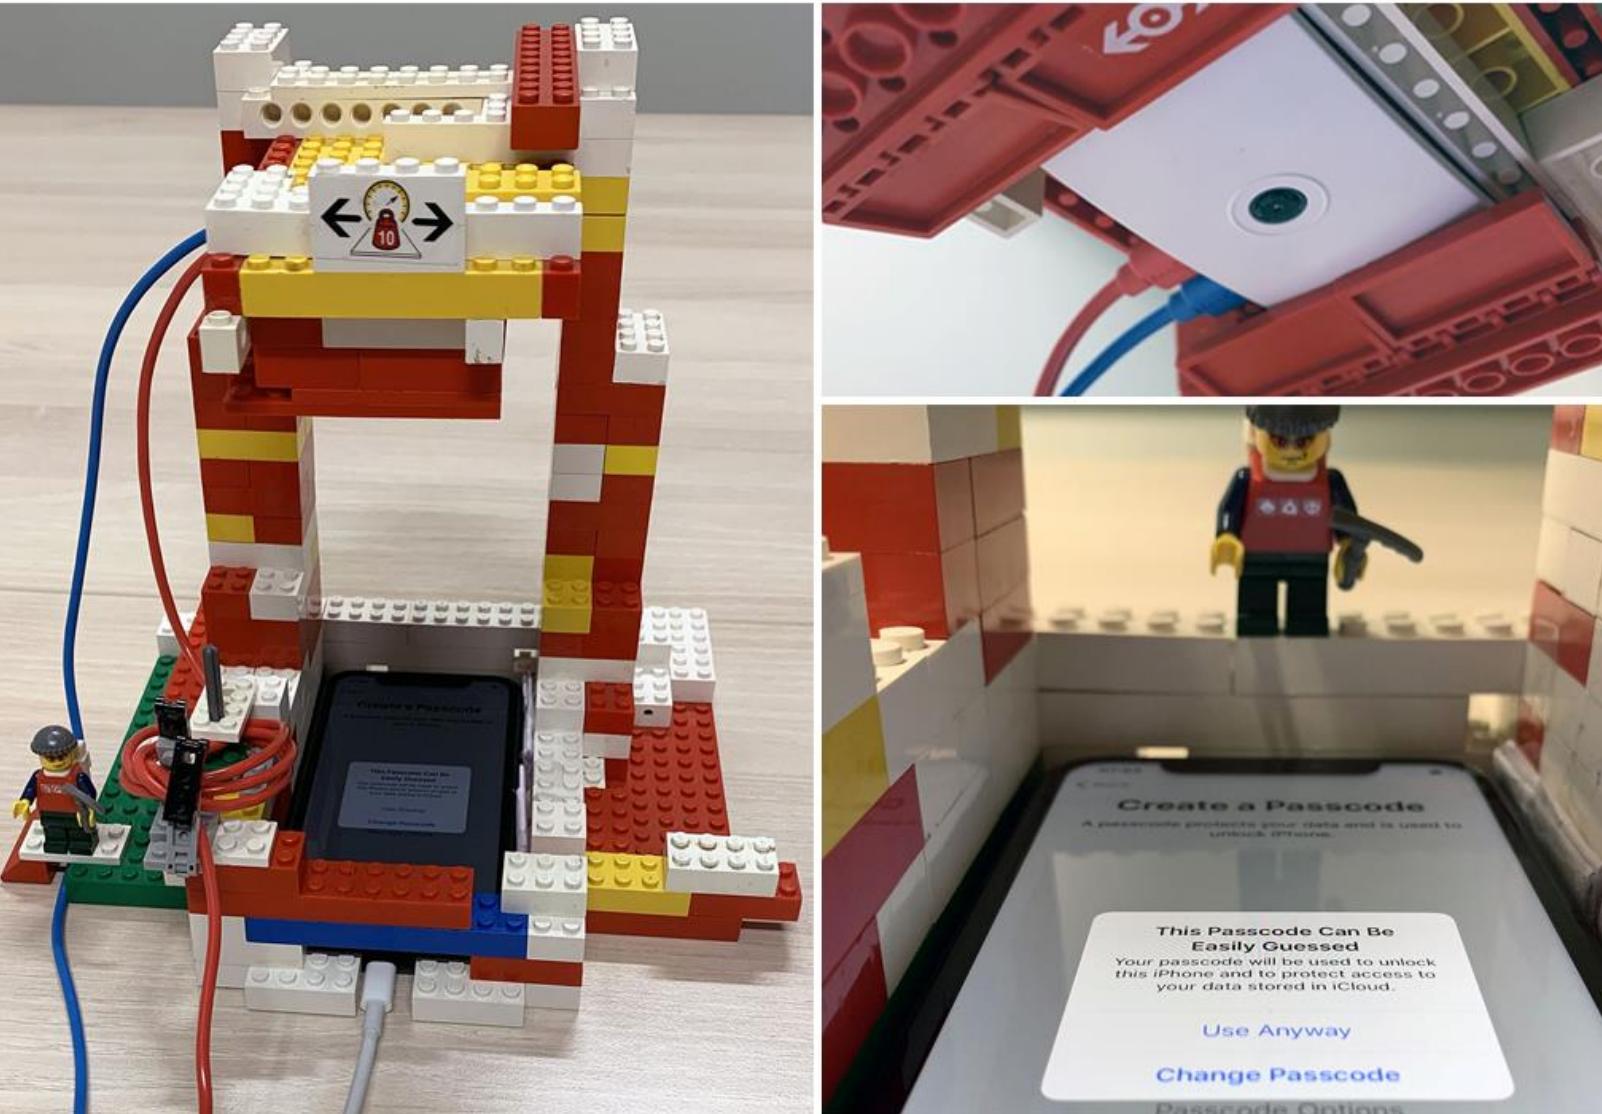

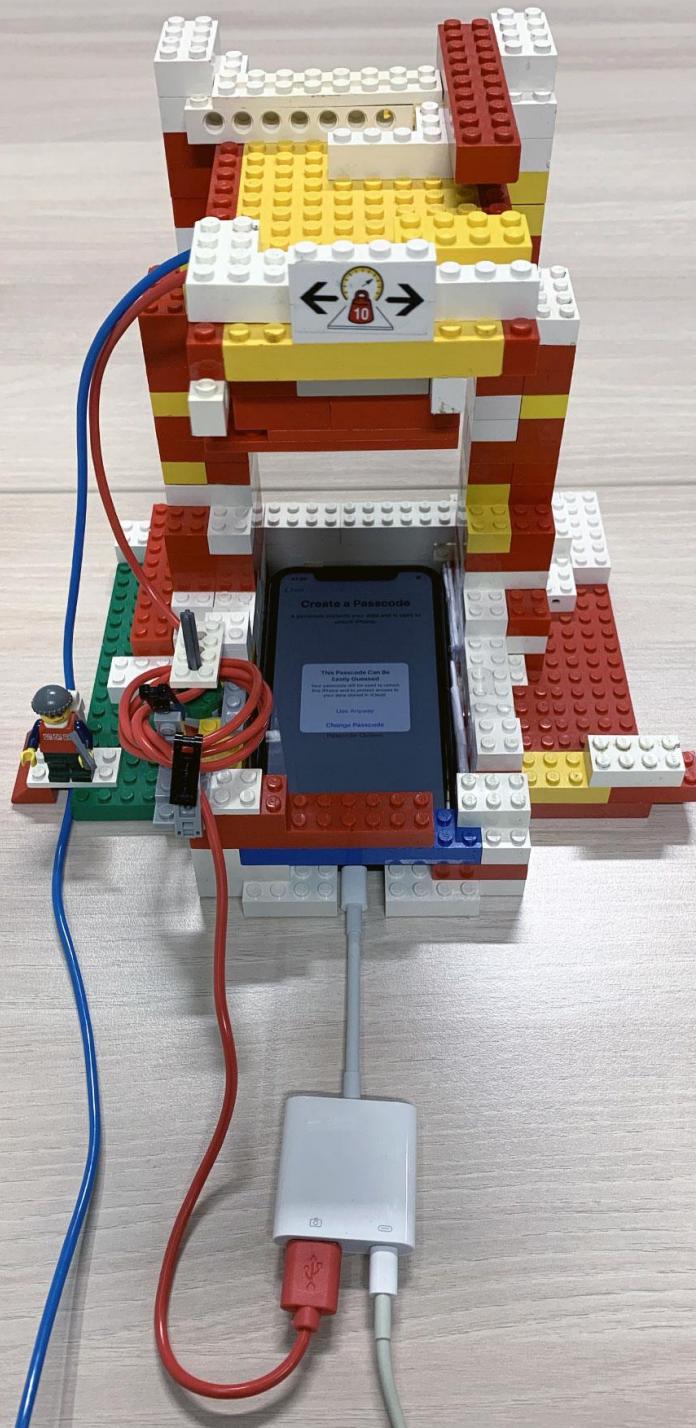

Create a Passcode

The iOS screen reader called VoiceOver is active.
To turn VoiceOver off, triple-click the Home button.

Interlocking Plastic Bricks Robot

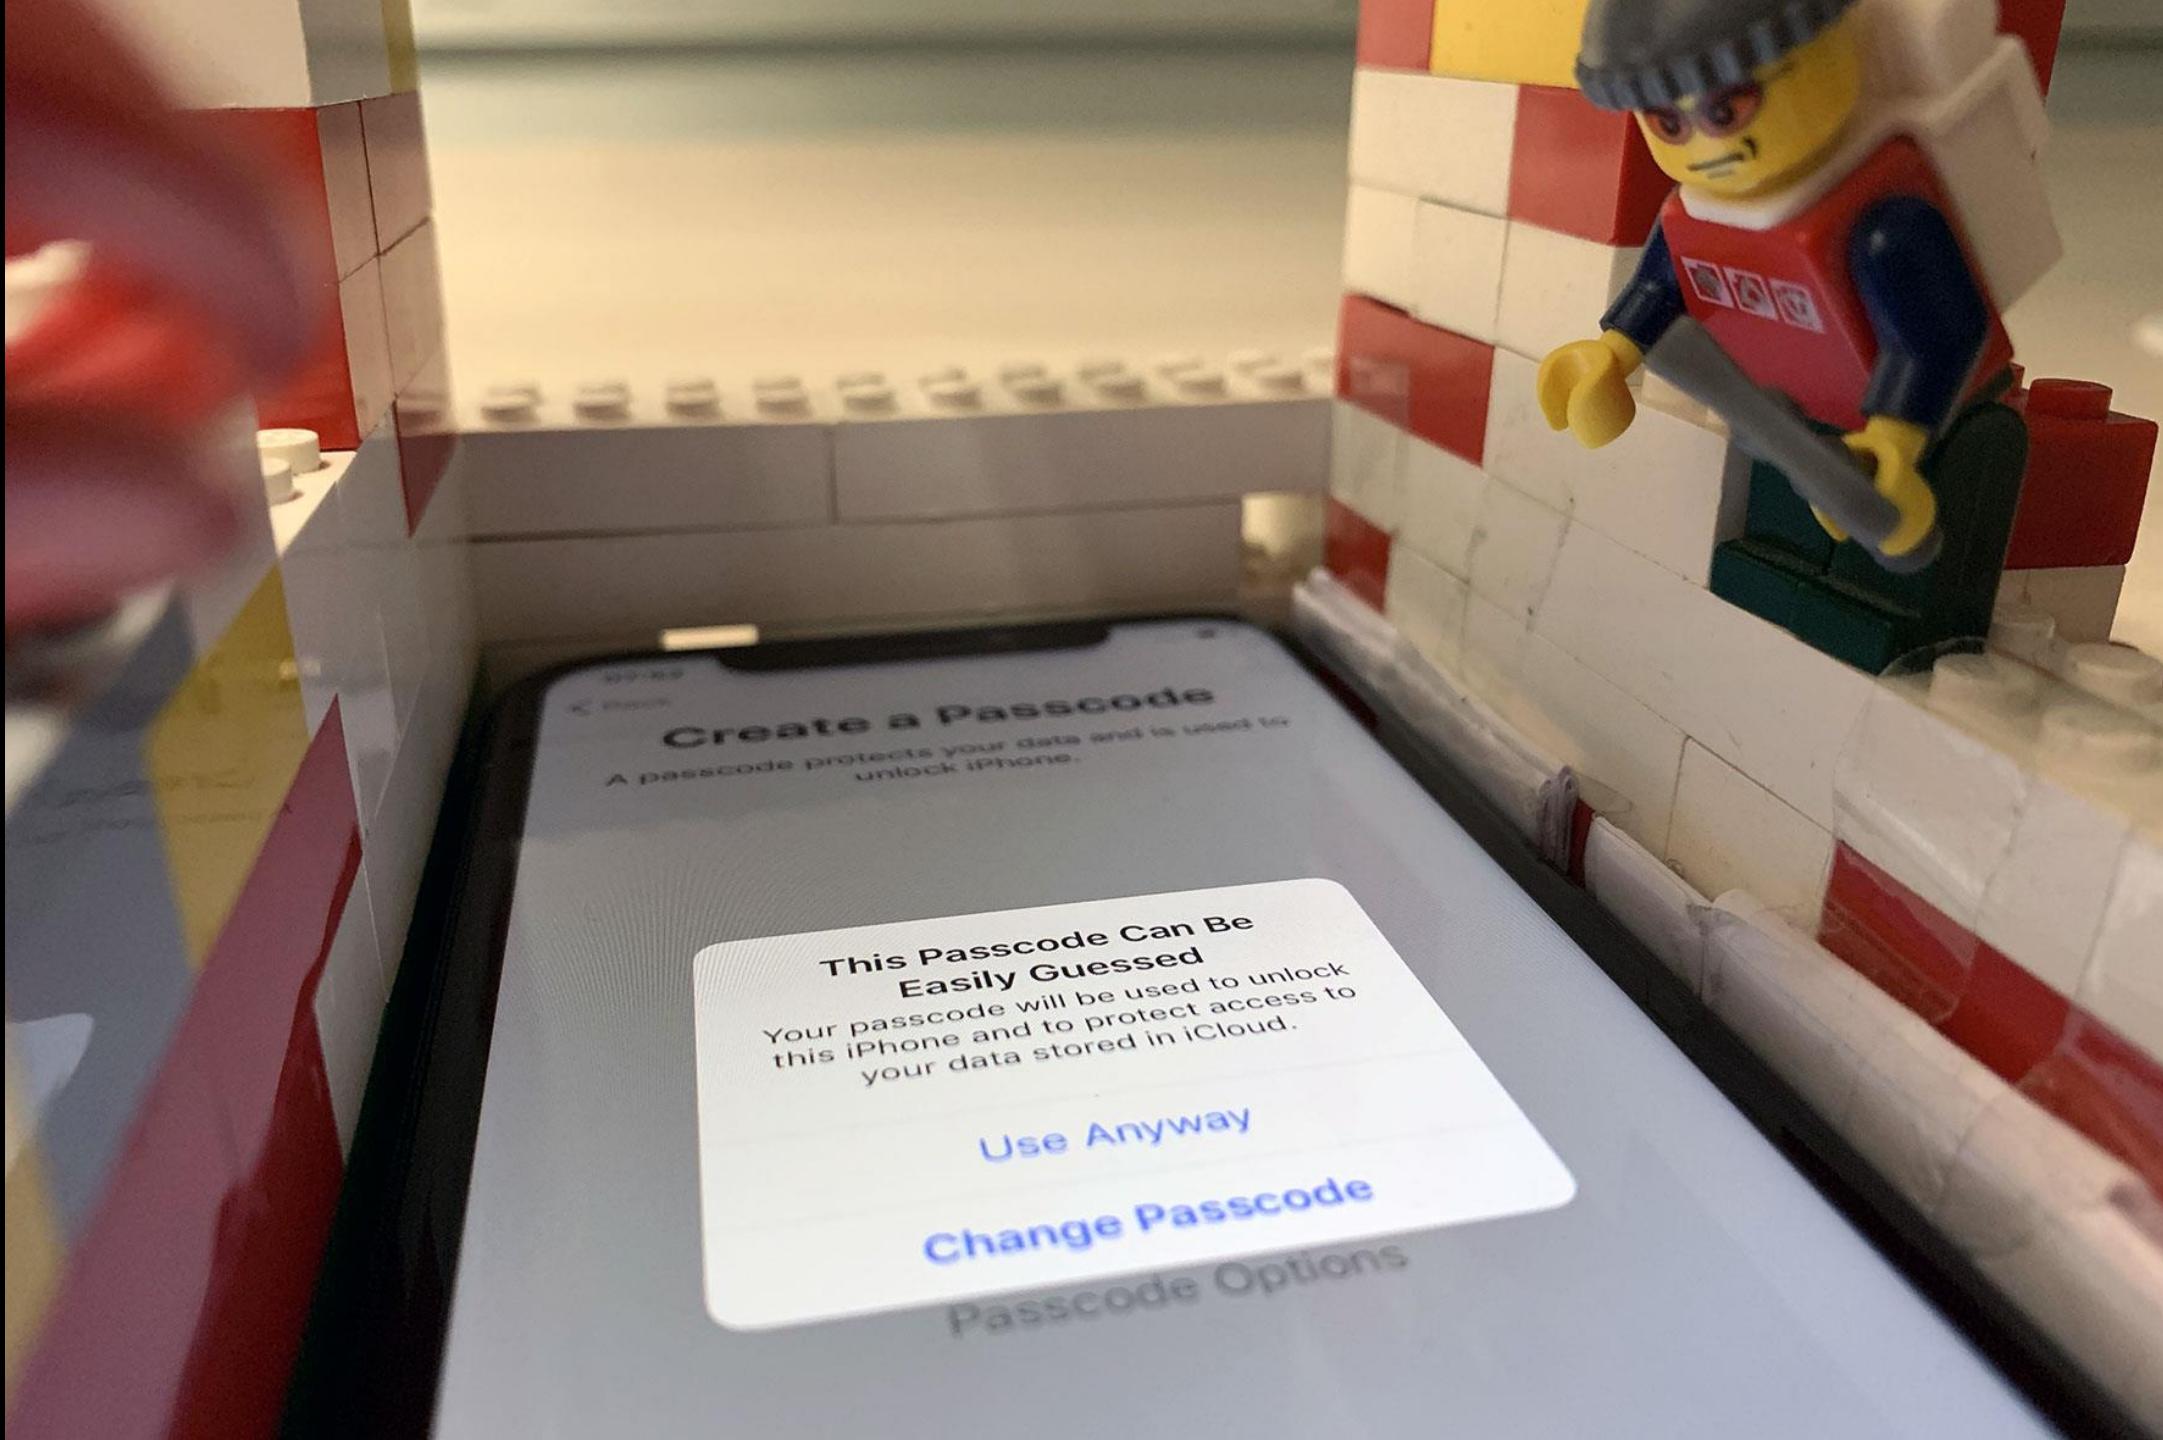

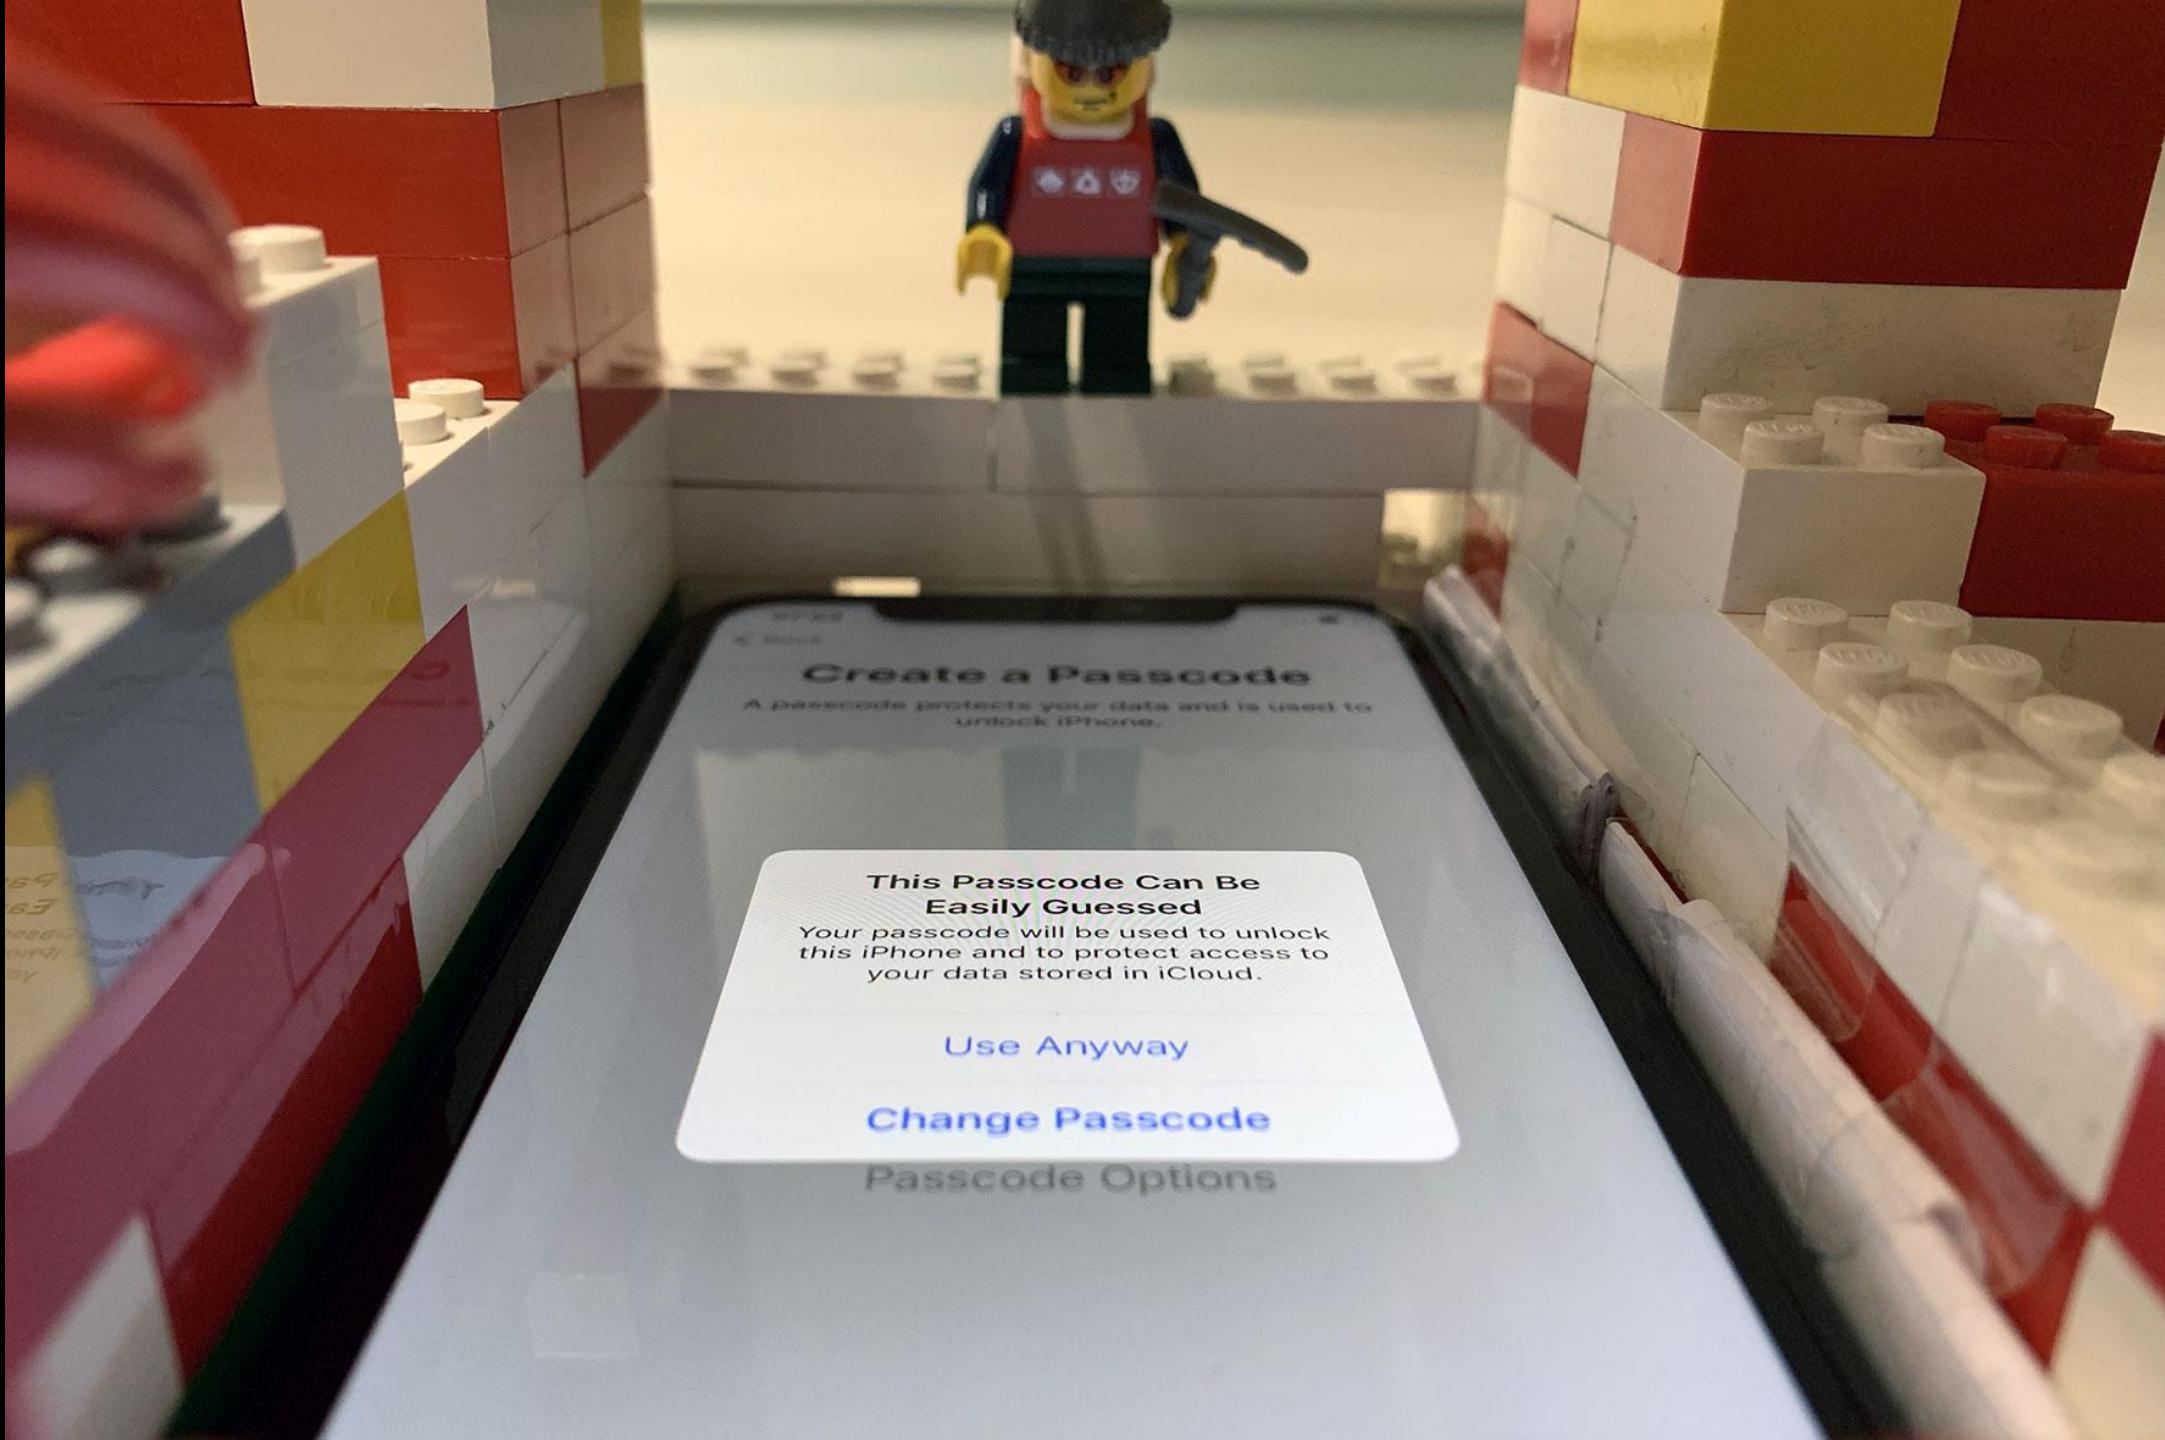

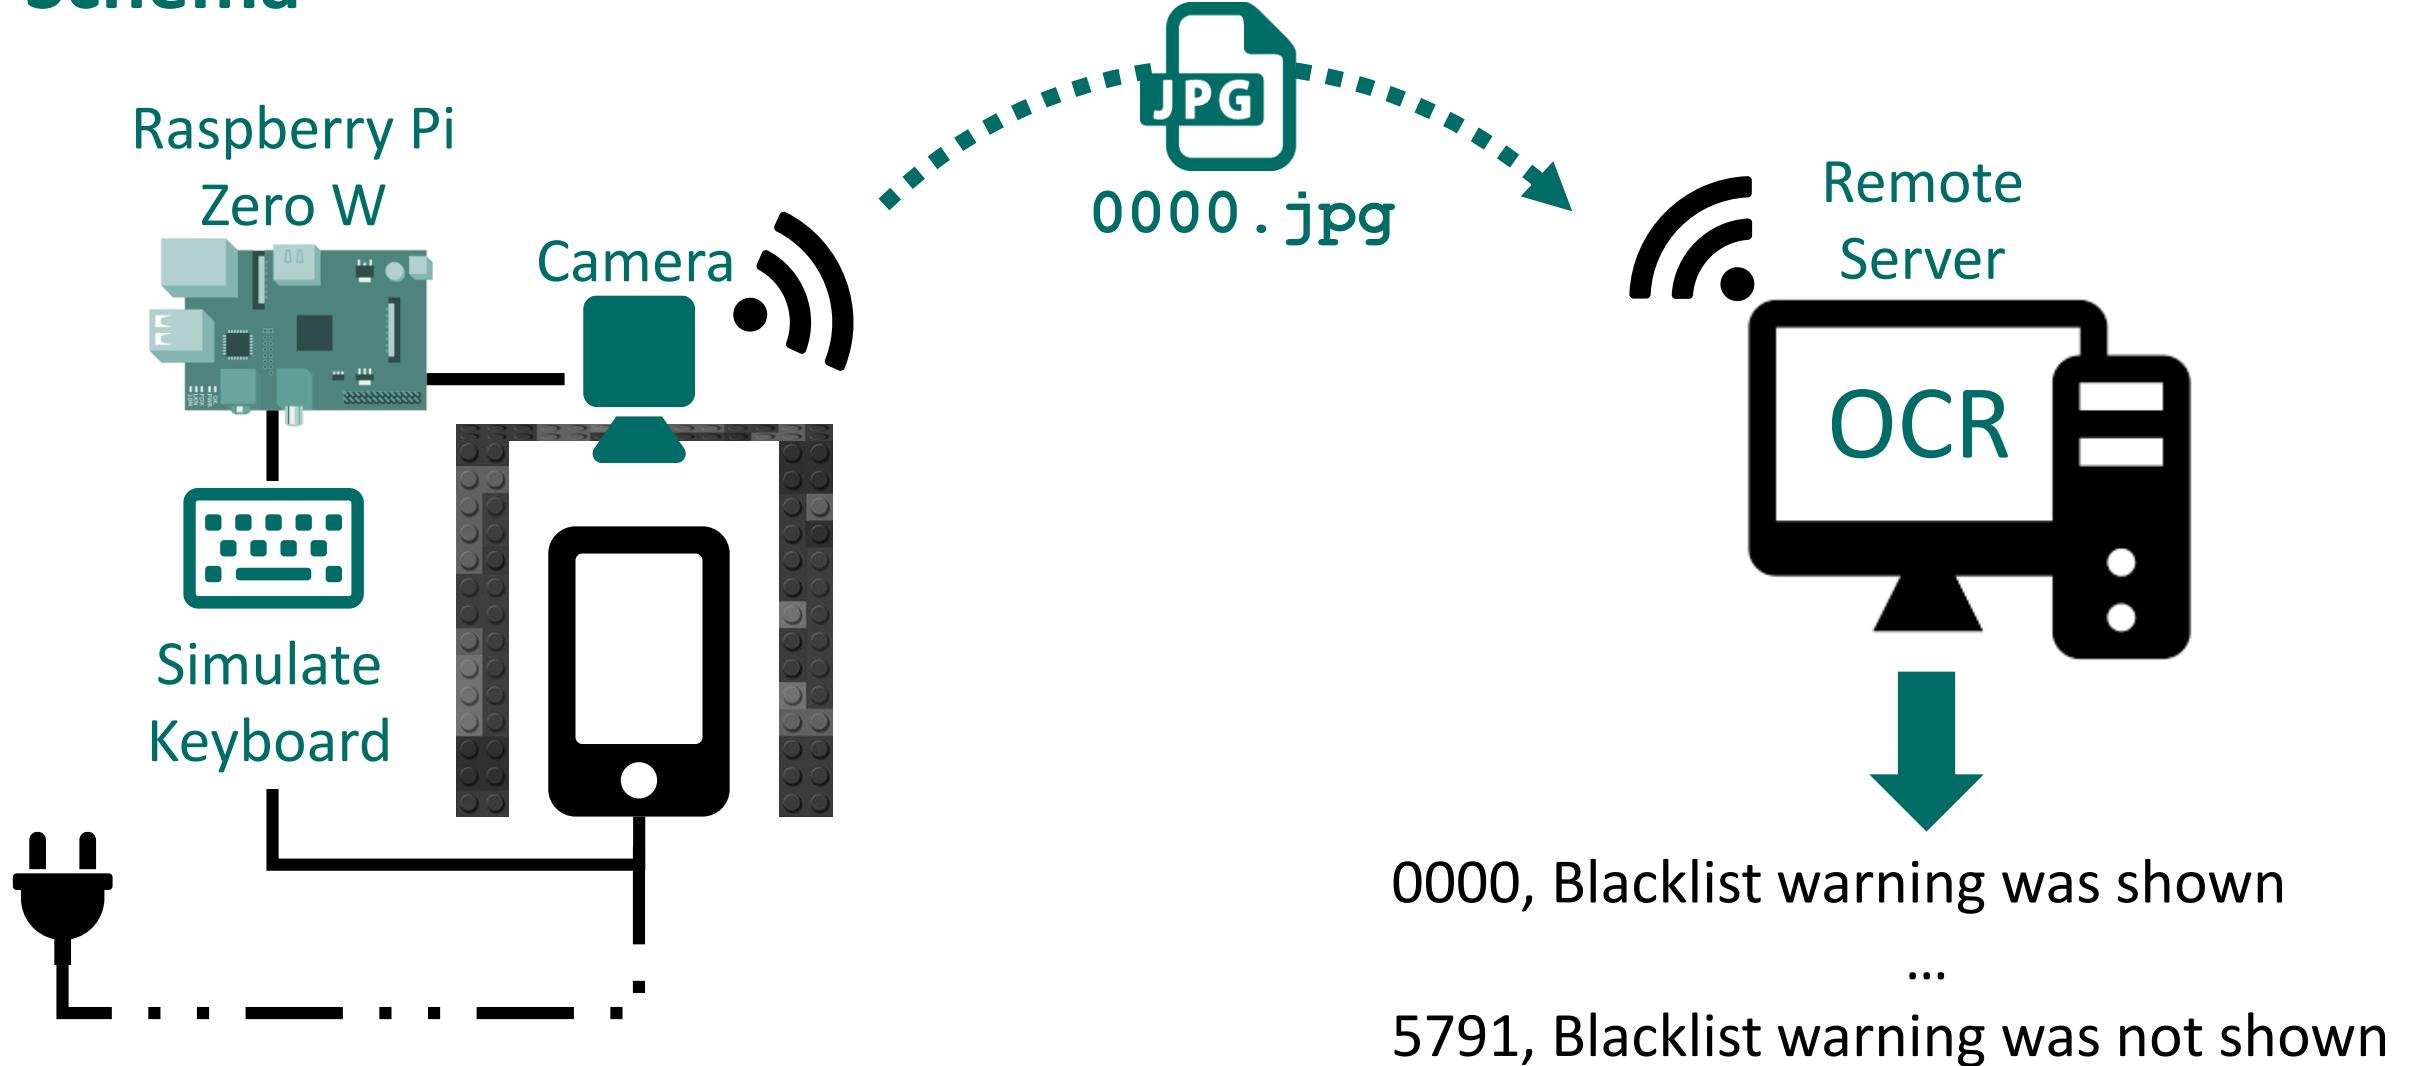

Schema

Parts List (~\$100 + Phone)

- 1x Raspberry Pi Zero W – \$30
 - ✓ Case
 - ✓ Power supply
 - ✓ Micro SD card
- 1x Raspberry Pi Camera Module v2 – \$25
- 1x Micro USB cable – \$5
- 1x Lightning to USB 3 Camera Adapter – \$39
- 1x Apple iPhone 6s (or newer) – ~\$150
- Some interlocking plastic bricks

Turn a Raspberry Pi Zero W Into a Keyboard

The screenshot shows a GitHub repository page for 'pi-as-keyboard' by c4software. The repository title is 'c4software / pi-as-keyboard'. It has 7 watches, 78 stars, and 22 forks. The 'Code' tab is selected. The repository description is 'Make your Raspberry act as a Keyboard'. It uses tags for 'raspberry-pi', 'keyboard', and 'linux'. The repository statistics show 34 commits, 1 branch, 0 packages, 0 releases, 2 contributors, and Apache-2.0 license. The latest commit was on Oct 25. The commit history includes:

- c4software Update test.sh (3 years ago)
- LICENSE (Update LICENSE) (last month)
- README.md (Update README.md) (last month)
- enable_hid.service (Restart service on failure.) (4 months ago)
- enable_hid.sh (Add Mouse and Keyboard sample) (4 months ago)

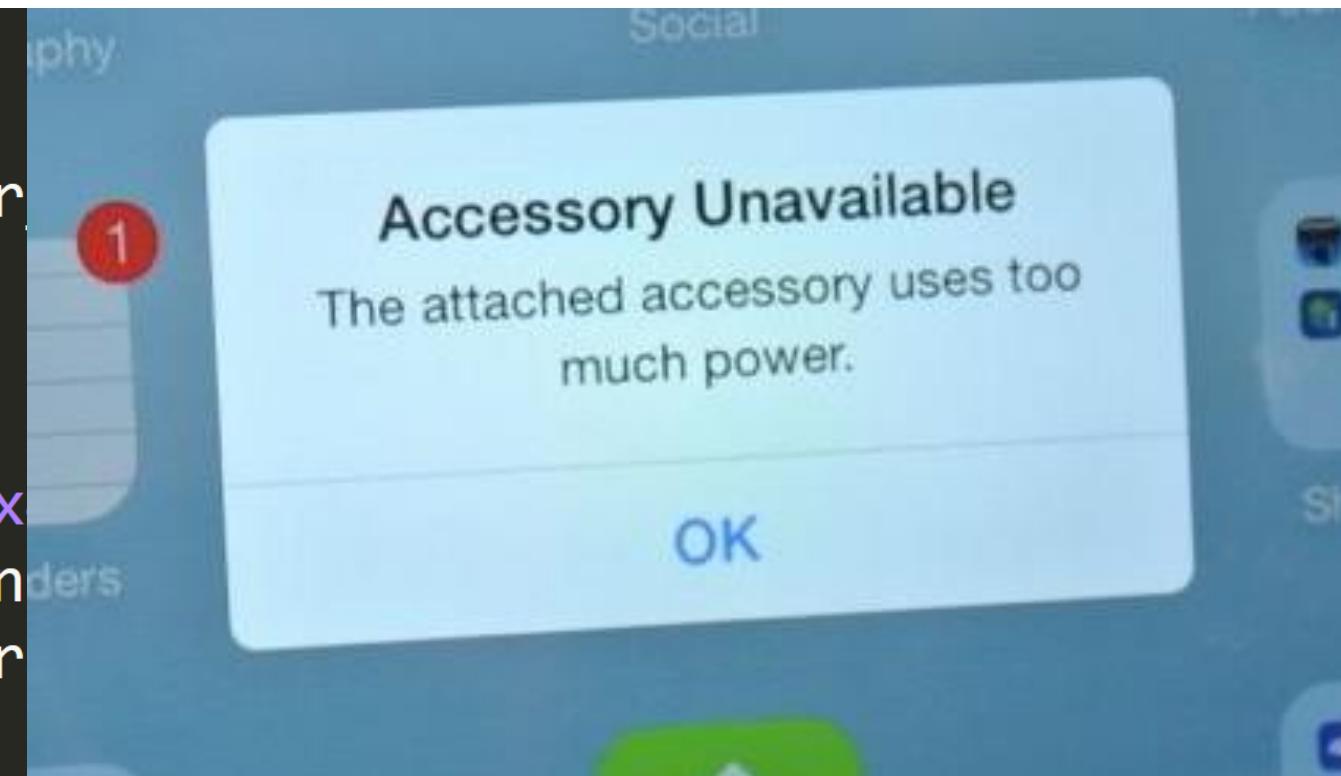

At the bottom, there are links for 'Find file' and 'Clone or download'.

The iOS Passcode Blacklist

4-digit Passcodes:

Search: ~9h (1x Setup)

Key space: 10,000 PINs

Blacklisted: 274 PINs (2.74%)

- **Common PINs:** Bonneau et al. [1]
- **Years:** 1956-2015
- **Patterns:**
 - ✓ aaaa
 - ✓ abab
 - ✓ aabb

6-digit Passcodes:

Search: ~30 days (2x Setups)

Key space: 1,000,000 PINs

Blacklisted: 2910 PINs (0.29%)

- **Common PINs:** Wang et al. [2]
- **Ascending/Descending:** “543210”
- **Patterns:**
 - ✓ aaaaaa
 - ✓ abcabc
 - ✓ abccba

Lessons Learned

- Be prepared to reset the devices
- iOS 9.3.5 blacklist != iOS 10.3.3 blacklist
- Mute the phone, because it is called
“VoiceOver”!
- We reduced the brightness to a minimum,
still, 2x iPhones were harmed in the process

Responsible Disclosure

To: product-security@apple.com

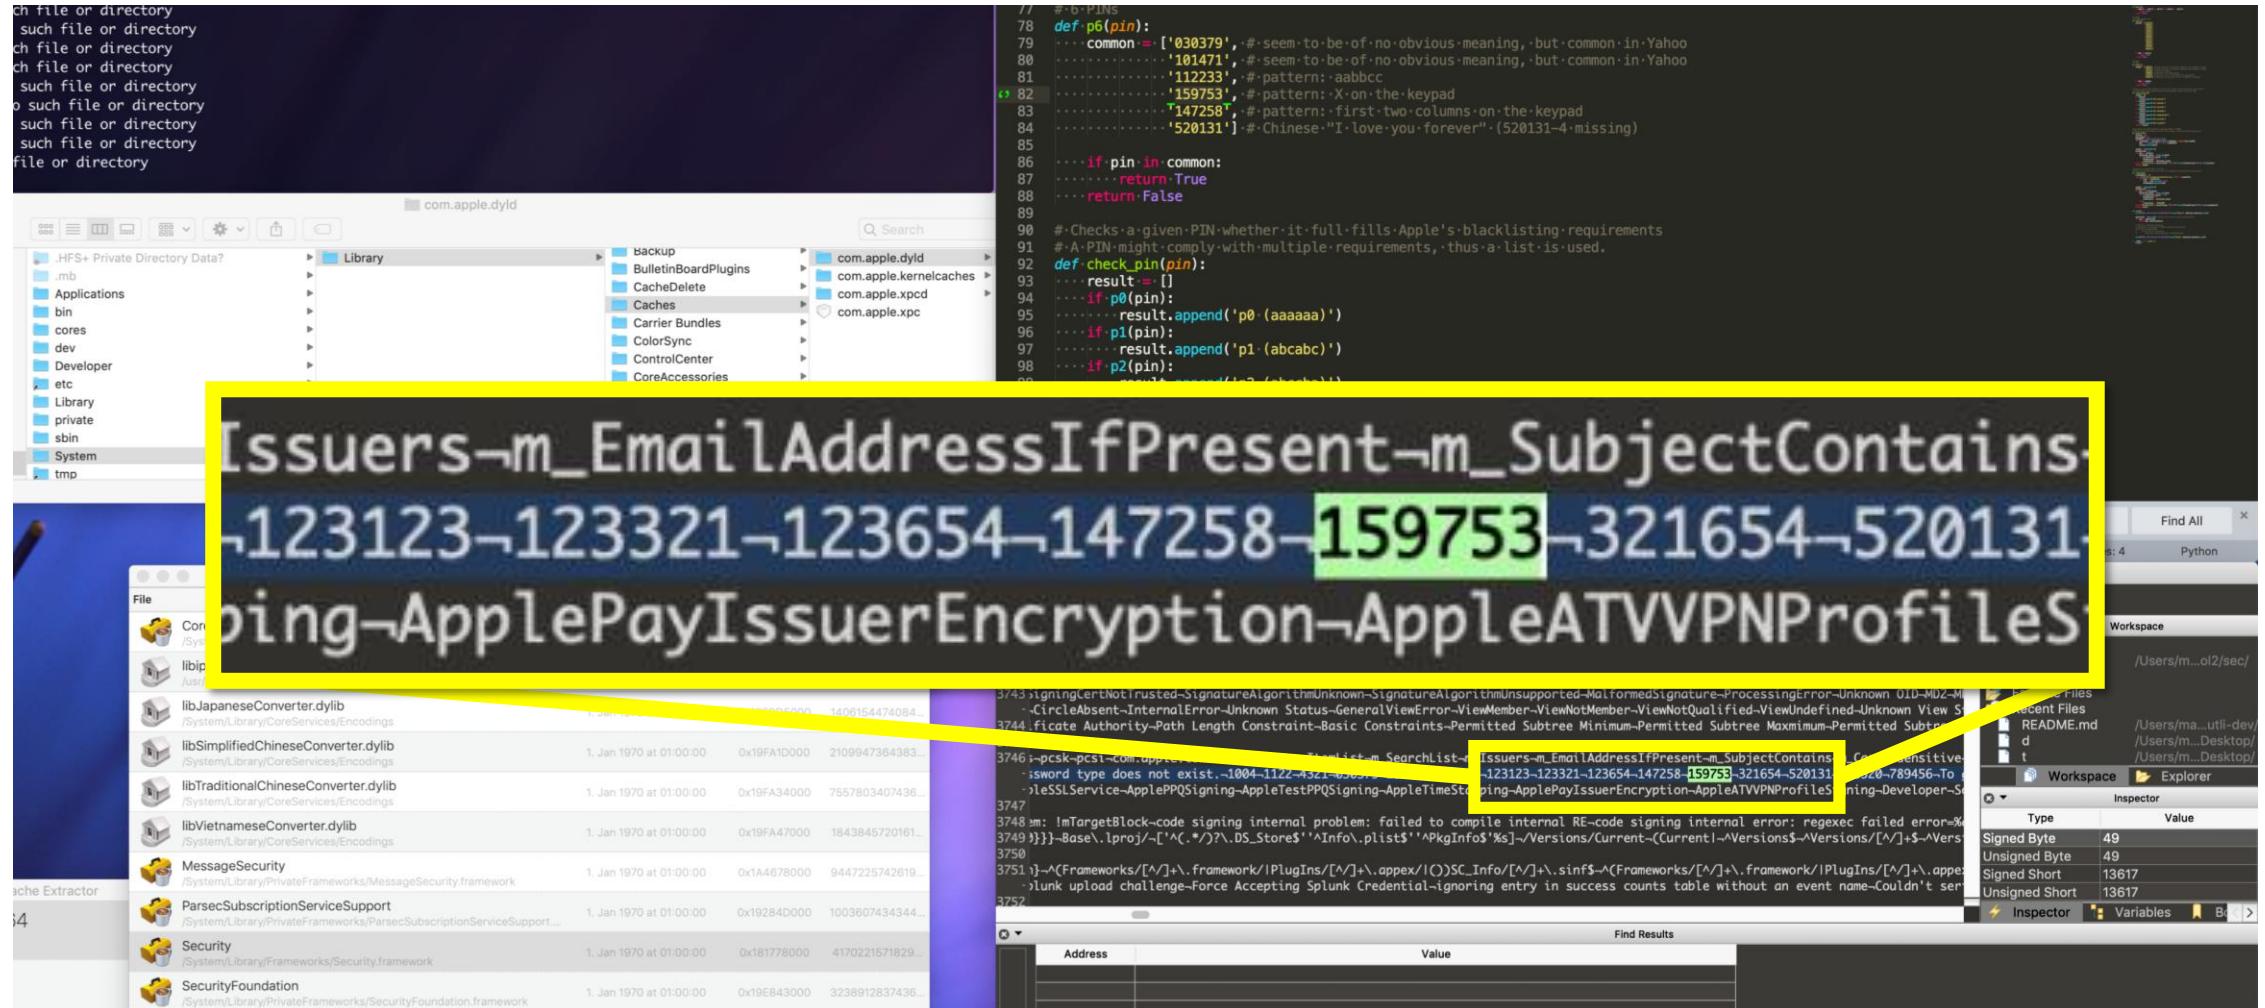

Hello Apple Product Security,

We would like to responsibly disclose some vulnerabilities we discovered while conducting research into iOS numeric 4- and 6-digit Passcodes.

First, during the initial setup of an iOS device where a user can create a Passcode, we found that there is **no rate-limiting in place**. While the initial setup phase has no data worth protecting, this flaw allows a user to enumerate all Passcodes that are deemed not strong enough, or "blacklisted" by iOS 9-12, and we did so for 4- and 6-digit numeric Passcodes for the purposes of academic research. We enumerated the blacklist by detecting when iOS prompts the user with the warning message:

Great Robot, But Isn't There an Easier Way?

Extracting the “Common” Passcodes Directly From the IPSW

1. Download and install Malus-Security/iExtractor by Răzvan Deaconescu
(A tool for macOS to automate the extraction of data from iOS firmware files.)
2. Download and decrypt the latest iOS version using iExtractor
3. Use the following code to extract the PINs directly from the dyld_shared_cache:

```
VERSION="13.3.1_17D50"
CODENAME="YukonD17D50.D22D221OS"
FILE="dyld_shared_cache_arm64" # or "dyld_shared_cache_armv7s" for iOS 7 to 10.3

hdiutil attach decrypted.dmg

strings /Volumes/$CODENAME/System/Library/Caches/$FILE | \
grep "\bSecPasswordSeparator\b" -A 120 > blacklist_iOS_$VERSION.txt

hdiutil unmount $CODENAME
```
